

Cleanroom Floor series

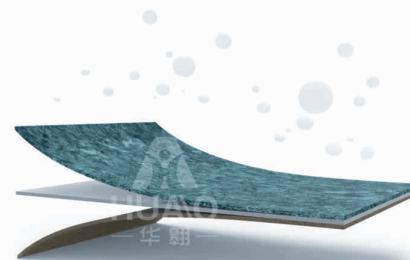

- PVC homogeneous permeable negative oxygen ion floor
- PVC multi-layer composite negative oxygen ion floor

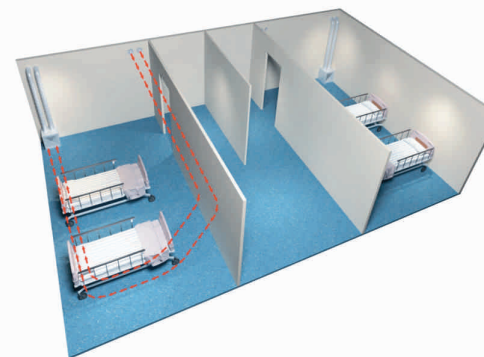

Dechuang Kunling negative ion purification PVC floor is based on the fact that the floor can continuously induce negative oxygen ions, increase the concentration of negative oxygen ions in indoor air, and has a unique purification effect. In biological laboratories, especially in the construction of P3 and above laboratories, the added value brought by the floor can make the air cleanliness in the laboratory reach the seventh to eighth levels specified in China's GB50073-2001 "Cleanroom Design Specifications", which can ensure that the airflow in the laboratory flows from the "clean" area to the "polluted" area.

COLIN SERIES

It can induce the release of negative oxygen ions to effectively activate cells, relieve fatigue, remove indoor odors, purify indoor air, and is antibacterial, anti-slip, corrosion-resistant, waterproof, moisture-proof, and easy to clean.

Product characteristics

Negative oxygen ions can capture floating dust, condense and precipitate it, thus purifying the air. When the concentration reaches 20,000/cm³, the floating dust in the air will be reduced by more than 98%. The smaller the diameter of the floating dust, the easier it is to be precipitated. Therefore, in the air containing high concentrations of negative oxygen ions, the dust, bacteria, viruses, etc. with a diameter below 1μm are almost zero, thus creating an air environment that is harmless to the human body.

DECHENG COLIN SERIES

Type: PVC homogeneous permeable negative oxygen ion floor Length and width: 20mX2m, 15mX2m Thickness: 2.0mm, 3.0mm
